## 1 Usage

`\newcommandtwoopt`  
`\renewcommandtwoopt`  
`\providecommandtwoopt`

Similar to `\newcommand`, `\renewcommand` and `\providecommand` this package provides commands to define macros with two optional arguments. The names of the commands are built by appending the package name to the  $\LaTeX$ -pendants:

```
\newcommandtwoopt    {\langle cmd \rangle} [\langle num \rangle] [\langle default1 \rangle] [\langle default2 \rangle] {\langle def. \rangle}
\renewcommandtwoopt  {\langle cmd \rangle} [\langle num \rangle] [\langle default1 \rangle] [\langle default2 \rangle] {\langle def. \rangle}
\providecommandtwoopt {\langle cmd \rangle} [\langle num \rangle] [\langle default1 \rangle] [\langle default2 \rangle] {\langle def. \rangle}
```

Also the `*`-forms are supported. Indeed it is better to use this ones, unless it is intended to hold whole paragraphs in some of the arguments. If the macro is defined with the `*`-form, missing braces can be detected earlier.

Example:

```
\newcommandtwoopt{\bsp}[3][AA][BB]{%
  \typeout{\string\bsp: #1,#2,#3}%
}
\bsp[aa][bb]{cc} → \bsp: aa,bb,cc
\bsp[aa]{cc}     → \bsp: aa,BB,cc
\bsp{cc}        → \bsp: AA,BB,cc
```

## 2 Installation

### 2.1 Package

Run `twoopt.ins` through  $\TeX$  to get file `twoopt.sty`:

```
tex twoopt.ins
```

Move the file `twoopt.sty` into a directory that is searched by  $\LaTeX$ . As location in a TDS tree I recommend:

```
texmf/tex/latex/oberdiek/twoopt.sty  or
texmf/tex/latex/misc/twoopt.sty
```

### 2.2 Documentation

#### 2.2.1 With $\LaTeX$

If you have package `hyperref` installed and want to use another driver than the default, use the configuration file `hyperref.cfg` to set your driver choice:

```
\hypersetup{<your driver>}
```

The following commands produce the documentation, don't forget `MakeIndex`'s option `-r`, if you use `hyperref` (eventually you need another cycle with `MakeIndex` and  $\LaTeX$ ):

```
latex twoopt.dtx
makeindex -rs gind twoopt
latex twoopt.dtx
makeindex -rs gind twoopt
latex twoopt.dtx
```

#### 2.2.2 With $\pdf\LaTeX$

Package `hyperref` for hyperlinks and package `thumbpdf` for thumbnails are supported. Generate the pdf file with the following commands (eventually you need another cycle with `MakeIndex` and  $\pdf\LaTeX$ ):

```
pdflatex twoopt.dtx
makeindex -rs gind twoopt
pdflatex twoopt.dtx
makeindex -rs gind twoopt
pdflatex twoopt.dtx
thumbpdf twoopt
pdflatex twoopt.dtx
hothread twoopt.dtx
```

Within the current pdfTeX there are still problems and bugs with the thread support. The perl script `hothread(.pl)` reads the informations of the `.pdf` and the `.log` file and corrects the `.pdf` file by appending an update section.

### 3 Implementation
